The products - Condensate, while the complete MTA PassLeader certification study guides are condensed by IT professionals. Many students have complained that there are too many questions and answers in so many practice exams and study guides, and are too tired to pay more. Seeing this, PassLeader experts work on this condensed version, while still ensuring that all knowledge is covered in depth research and analysis. It's all about making comfort for candidates on their way to certificates! The Service - Instant and Convenient PassLeader offers 24*7 customer service: pre-sale and after-sales. PassLeader live chat feeds make sure candidates can get instant help when shopping online. Online chat, online payment and online download ensure such high comfort that customers can complete a transaction in less than half an hour. Pre-sale - Free demo test Before you buy the MTA exam, you can try this free demonstration of MTA exam questions. It's an MTA Passleader.com show that will show you how it looks and works. This trial version is absolutely free and easy to download. After sale - Pass guarantee and Passleader.com MTA braindumps is certainly a passport for success in MTA exam tests. We guarantee you'll pass, and with a high score. If, however, you still worry that you may fail, don't worry then. Passleader.com your money 100%. This is absolutely a risk of free online shopping. CERTIFICATION: MTA (Microsoft Technology Associate) Free MTA and MTA exam questions dumps 100% Free Microsoft MTA Certification Practice Test questions with the latest updates and accurate answers. All Microsoft MTA exam dumps are uploaded by users who have passed the exam themselves. Microsoft MTA certification practice test questions help exam candidates pass certification exams quickly. Quick question updates, precise answers verified by industry experts are available in pass order using Microsoft MTA Dumps and study from the latest question group. 27 Questions | Total attempts: 15941 Tracks the MAC addresses attached to each of its ports and directs traffic to a particular address only to the port to which it is attached. Tracks the IP addresses attached to each of its ports and directs traffic to a particular address only on the port to which it is connected. It operates in the physical layer of the OSI model. It operates in the Data-Link layer of the OSI model. As part of a training exercise, you have been asked to identify the layer that allows applications and a number of useful features to access the network. Which of the following options represents your answer? You have to make sure that a client's network includes a server that converts netbios names into IP addresses. Which of the following actions should be taken? You should consider adding a DHCP server to the client's network. You should consider adding one of the on the client's network. You should consider adding a web server to the client's network. You should consider adding a WINS server to the client's network. A network of clients is like this for two network segments, called subnet A and subnet B. DHCP clients are on subnet A. A DHCP server on subnet B. You need to make sure that DHCP clients can connect to the server. Which of the following actions should be taken? You must make sure the RRAS service is configured. Make sure the WEB service is configured. Make sure the DNS service is configured. You must make sure the DHCP relay agent service is configured. You are in the process of designing an FDDI network for a customer environment. Which of the following is TRUE when it comes to an FDDI network? An FDDI network cannot contain rings longer than 100 kilometers respectively. An FDDI network can contain rings exceeding 100 kilometers respectively. Each ring on an FDDI network can support a maximum of 500 nodes. Each ring on an FDDI network can support a maximum of 50 nodes. You are in the procedure of designing a home network for a client. You have decided to make use of 10BaseT wiring. Which of the following options are TRUE for 10 BaseT wiring? The 10BaseT cables are made up of twisted torque cables that are up to 100 meters long. The 10BaseT cables are made of twisted torque cables that are up to 10 meters long. 10BaseT cables allow the system to work at 10Mbps. 10BaseT cables allow the system to work at 100 Mbps. The client must have a modem. The client must have a server. The customer must have a switch. You executed the NBTSTAT command with the -S parameter from the work station command line. Which of the following describes the reason for executing this command? In order to view the names registered locally by netbios applications. In order to view the current netbios sessions and their status, with the IP address. In order to purge the cache of the name. For the purpose of seeing the NetBIOS session table converting destination IP addresses into computer netbios names. Users reported experiencing network connectivity problems. You decide to run the ping-E command from the command line. Which of the following describes the purpose of using the ping-l command? Allows you to specify a time to live for outgoing packages. Specify the type of service. Specify the amount of data to be included in ping. Allows you to resolve addresses to host names. A client would like to connect your two home computers. You need to solve the problem without using unnecessary hardware. Which of the following actions should be taken? You must make use of a hub and a UTP crossover cable with RJ-45. You must make use of a hub and a UTP crossover cable RJ-11 connectors. You should make use of a UTP crossover cable with RJ-45 connectors. You should make use of a UTP crossover cable with RJ-11 connectors. A customer has requested the installation of a T3 Internet connection for their offices. Which of the following is TRUE when it comes to Internet T3 connections? T3 Internet connections have a minimum transmission speed of 64 Mbps. Internet T3 connections have a minimum transmission speed of 56 Kbps. Internet T3 connections have a minimum transmission speed of 10 Mbps. T3 Internet connections have a minimum transmission speed of 128 Mbps. The client's network consists of a single domain called ABC.com. The client's network connects to the Internet via an ISDN connection. Which of the following is TRUE when it comes to the ISDN connection? ISDN operates at a minimum speed of 128 Kbps. ISDN operates at a maximum speed of 128 Mbps. ISDN operates at a maximum speed of 128 Kbps. After pinging the client's ISP DNS server address, you find that the ISP server is down. Then you decide to run the ping-t command from the command line. Which of the following describes the purpose of this order? Allows the ping command to continue sending Echo Requests messages to the ISP server until it is interrupted. Performs reverse name resolution on the IP address of the ISP DNS server. Send Echo Request messages with the non-fragment signal to the IP header set to 1. Send Echo Request messages a specified amount of times. You are responsible for running training exercises for trainee administrators. You are currently covering the layers of the Open systems interconnect (OSI) model. You are explaining the data link layer. Which of the following best describes the data link layer of the OSI model? The data link layer deals with the transmission and reception of the unstructured raw bitflow over a physical medium. The data link layer controls the operation of the subnet. The data link layer deals with error-free transfer of data frames from one node to another over the physical layer. The data link layer ensures that messages are transmitted without errors, sequentially, and without loss or duplication. You have been instructed to design a network based on TCP/IP. You must configure the use of an appropriate name resolution policy that makes provisioning for Windows and Unix computer on the network. Which of the following actions should be taken? You should make use of DNS as the name resolution strategy. You should make use of DHCP as the name resolution strategy. You must use the Peer Name Resolution Protocol as a name resolution strategy. A client has replace its existing network wiring. They have requested that the replacement wiring meet the following requirements: It should not be affected by You must be able to transmit data over large distances. Which of the following actions should be taken? You should make use of the Coaxial cable. You have to make use of a fiber optic cable. You have to make use of twisted armored cable torque. You should make use of the Senseshielded Twisted-Pair cable. IPv4 addresses are represented in a decimal dot format, while IPv6 addresses are represented in a colon-hexadecimal format. IPv4 addresses are represented in a colon-hexadecimal format, while IPv6 addresses are represented in a decimal format with dots. IPv4 addresses make use of the last 32 bits of IPv6 addresses for interoperability. IPv4 addresses make use of the first 32 bits of IPv6 addresses for interoperability. You are designing a network that will have two subnets, called Subnet A and Subnet B, connected to a router. To save cost, ABC.com you want to make use of an existing router that cannot be configured to support BOOTP. Subnet A will host a DHCP server, while subnet B will have a DHCP relay agent configured. Which of the following is TRUE regarding DHCP Relay Agent? (Choose two) It is used to prevent broadcast traffic through the two subnets. It is used to pass broadcast traffic through both subnets. It allows a remote access client to get an IP address on the intranet to which the LAN adapter of a VPN server is connected, whether it is configured on the VPN server or not. Allows a remote access client to get an IP address on the intranet to which the LAN adapter of a VPN server is connected if it is configured on the VPN server. You are in the process of connecting a 100BASE-SX Gigabit Ethernet into a customer office block. Which of the following statements is TRUE regarding 100BASE-SX? Requires multi-mode fiber optic cable. Requires single-mode fiber optic cable. You can work at distances greater than 70 Km. The maximum length of a cable segment is 10 Km. You are in the process of designing a ring network for a client. Which of the following is an advantage of a ring network? A Ring network manages connectivity between workstations without the need for a central node. When you connect or delete devices on the Ring network, there are no interruptions. A ring network prevents the passage of data packages through an excessive number of nodes. The number of nodes on a ring network has no impact on communication delays. You are in the process of designing a Star network for a customer. Which of the following is an advantage of a Star network? A stellar network manages connectivity between workstations without the need for a central node. When you connect or delete devices on the Star network, there are no interruptions. A Star network allows data packets to pass through an excessive number of nodes. The failure of the center center has no impact on a Star network. You are the purpose of a dual stack node on the network. Does whic of the following adequately represent this explanation? Allows you to communicate an IPv6 IPv6 socket an IPv4, and IPv6 peer in the transport layer of the OSI model. It allows an IPv6 socket to communicate with an IPv4, and IPv6 peer to the physical layer of the OSI model. Allows an IPv6 socket to communicate with an IPv4, and IPv6 pair in the data link layer of the OSI model. Allows an IPv6 socket to communicate with an IPv4, and IPv6 companions in the session layer of the OSI model. You recently designed a network for a client, using fully connected mesh topology. Which of the following is TRUE in terms of this type of topology? It is the connectivity between workstations without the need for a central node. It does not require the use of switching or dissemination. Avoid the number of data packets through an excessive number of nodes. The number of nodes in a fully connected mesh network has no impact on communication delays. You are responsible for running training exercises for trainee administrators. You are currently covering the layers of the Open Systems Interconnect model. You are explaining the transport layer. Which of the following best describes the transport layer of the OSI model? The transport layer deals with the transmission and reception of the flow of unstructured raw bits on a physical medium. The transport layer controls the operation of the subnet. The transport layer deals with the error-free transfer of data frames from one node to another over the physical layer. The layer transports ensures that the messages are transmitted without errors, sequentially, and without loss or duplication. Duplications.
